Dr. Germán Ros Sánchez
Director, Simulation Ecosystem Dev at NVIDIA
Executive Director at Embodied AI Foundation

To Whom It May Concern,

I'm glad to recommend Antonio Mata for any Technical Artist role he is considering. I worked with Antonio in my role as Executive Director of the Embodied AI Foundation, where he became one of our most versatile contributors across a number of our simulation projects, a genuinely hybrid art-and-tools profile.

Antonio's strength is the combination of artistic skill and engineering. He is most at home in the shader and technical-art space: writing shaders, debugging rendering and normal issues, and authoring procedural tooling. He is comfortable reaching into C++ when a project needs a class extended or a feature added. He enjoys learning new technologies and is proactive when an area engages him. That blend, moving between art and tooling, is the core of what a Technical Artist role asks for, and Antonio brings that to a team.

Antonio has contributed across a meaningful slice of our simulation portfolio. On CARLA, the open-source autonomous driving simulator, he built procedural tooling for building generation, shaders, and PCG systems, and on our Digital Twins program he developed the procedural building generation tooling. On Explorer, our simulation program serving NASA and Caterpillar across space exploration and off-road verticals, he resolved shader and normal-rendering issues that were blocking customer-facing deliveries. He contributed shaders and cockpit programming to AeroSim, our aerospace collaboration with Supernal, the advanced air mobility company within Hyundai Motor Group. He also worked on NVIDIA's Isaac Sim, configuring robot joints and supporting Omniverse integration, and developed shaders for our space simulation platform with Northrop Grumman. That breadth across automotive, robotics, aerospace, and space has stretched both his technical-art and his tooling skills, and he has met it with curiosity and initiative.

Antonio has my strong recommendation for any Technical Artist position. I welcome the opportunity to discuss this further with any interested parties.

Dr. German Ros Sanchez,
Director, Simulation Ecosystem Development
